Site Report: SMART Irrigation Controllers Stop Wasting, Start Saving

Reduce outdoor water use - Maintain a healthy lawn - Save

SMART (ET) Controllers

Now every homeowner can participate in water conservation with a water-efficient irrigation controller!

Did you know?

A typical residential irrigation system uses anywhere from 1800 to 2500 gallons of water each night. This is not surprising when you consider that the majority of irrigation systems are only 50% water efficient. The result: countless gallons (and dollars) wash down the storm drains every watering cycle.

Now, imagine the savings if your irrigation controller could sense when your landscape requires irrigation. That technology now exists! SMART controllers constantly get current weather conditions to control when watering takes place.

IT IS TIME - update your irrigation system with a SMART Controller!

Most irrigation controllers simply use time to robotically irrigate -- even during rain. Left unattended, these outdated controllers over-water and waste money. Conventional irrigation controllers are almost never adjusted to account for changing weather patterns. Again, unadjusted, robotic operation over-saturates the soil, kills plants and wastes water and money.

Considering Minnesota's ever-changing weather patterns, an automatic SMART controller is an efficient and affordable solution!

Irrigation SMART controllers automatically adjust irrigation schedules in response to changing weather conditions. Local weather stations collect data and send weather information to the SMART controller daily. The controller then adjusts watering times and frequency. The SMART controller helps to maintain optimum moisture balance in the soil, resulting in stronger, healthier plants with deeper root systems, and **significant water savings--from 15% to 40%!**

Yes - I would like more information about installing a SMART controller at my home!

Fax or mail this document to Water in Motion and save **50%** on the purchase of a SMART
